Lists of Tables

Table 3.1  Summary of data set required by reactive power dispatch module ..........45
Table 3.2a Summary of data set required by real power dispatch module ..............46
Table 3.2b Technical minimum power output of different types of generating units ..................................................................................47
Table 3.3  Summary of data set required by reactive power controller pre-Selection mechanism ........................................................................48
Table 4.1  Applied parameters for GA based real power dispatch .........................64
Table 4.2  Results and comparison of three approaches for Duisburg power system (scenario 1) .....................................................................................67
Table 4.3  Results and comparison of three approaches for Duisburg power system (scenario 2) .....................................................................................70
Table 4.4  Summary of results and comparison of three approaches (high voltage transmission system) .................................................................73
Table 4.5  Summary of results of showing the dependence of unit based encoding GA on the number of bits .................................................................75
Table 5.1  Comparison of applied parameters for conventional - and micro - GA reactive power dispatch ........................................................................88
Table 5.2  Summary of results and comparison of conventional - and micro - GA based reactive power dispatch (Duisburg power system) ....................98
Table 5.3  Summary of results and comparison of conventional - and micro - GA based reactive power dispatch (high voltage transmission system) ......103
Table A.1  Generating unit cost coefficients for Duisburg municipal power system ..........................................................................................................149
Table A.2  Generating unit cost coefficients for 400/230/110 kV transmission system ..........................................................................................................150
